PinPoint Sweden

Growth Analysis is using and further developing a GIS platform under the name "PinPoint Sweden" (PiPoS). The platform contains tools and data for processing and describing complex geographic relationships. PiPoS has been developed primarily to process calculations concerning distance and time between different geographic areas, what is normally referred to as "accessibility analyses".

The Agency has by using PiPoS platform developed a proposal for a division of Sweden based on geographic accessibility to urban areas. The aim is to reflect accessibility of the population to a possible range of services.

The map on the front page shows the Agencies proposal for division of Sweden. The degree of accessibility in this map is divided into five different classes showing degree of accessibility.
